1.0 INTRODUCTION

1.1. STUDY OBJECTIVE

ARIK Engineering Ltd., has been retained by **5038257 Ontario Inc. (c/o Craig DeVries)** to prepare a functional servicing and stormwater management report for the proposed development at 272 Ridge Road South, Fort Erie, Ontario. The proposed development is located at east side of Ridge Road South. The development is bounded by Ridge Road South to the west, existing residential area to the north, south and east. There is an existing building located at the subject property which will need to be demolished. The proposed development comprises of approximately area of 0.54 ha.

An illustration of the project location is presented in key plan **Exhibit 1**.

Exhibit 1: Key Plan

The objective of this report is to prepare a functional site servicing and grading design for the subject development based on existing municipal sanitary, storm sewers and watermains.

The report will also describe stormwater management servicing concept related to stormwater quantity and quality in accordance with the current drainage and stormwater management policies and design criteria established by the Town of Fort Erie.

Figure A1 represents the proposed site plan for the subject lands in **Appendix A** for reference.

1.2. EXISTING TOPOGRAPHY AND DRAINAGE PATTERN

The subject property generally drains towards the mid-south portion of the property. The existing topography varies from a high elevation of approximately 181.3m along the northwest and northeast corners of the property to a low elevation of 180.2m along the mid-south portion of the property corner. There is an existing building is located at the west part of the property which is fronting on Ridge Road South. **Figure A2** represents the existing topography in **Appendix A**.

1.3. PROPOSED SITE PLAN DEVELOPMENT

The development will include construction of 18 townhouse units and associated visitor parking area. The site plan of the proposed development is attached in the **Appendix A** for reference.

2.0 DESIGN OF PRIVATE SANITARY, WATER AND STORM SERVICES

The Proposed development is located in the Town of Fort Erie and it is bounded by existing municipal roads which contain municipal sanitary sewers, storm sewers and watermains which can be utilized to servicing the subject lands. The design criteria used in this functional servicing report are based on the Town of Fort Erie current design and construction standards.

Existing municipal sewers and watermain on Ridge Road South will be able to service the proposed development. There is an existing 200mm sanitary sewer available on Ridge Road South will be able to service the proposed development.

There is an existing 1200mm municipal storm sewer available on Ridge Road South which drains from north to south. The existing 1200mm storm sewer on Ridge Road South may not have adequate capacity to accommodate uncontrolled post-development flows, therefore, onsite stormwater management storage will need to be provided and the post-development outflows from the site will have to match with the pre-development flow conditions.

An existing 150mm municipal watermain is available on Ridge Road South which can be utilized for water servicing of the subject development.

2.1. SANITARY SERVICES

Sanitary service for the subject site will be provided through the existing municipal sanitary sewer available on Ridge Road South. A profile drawing (refer to drawing # ISE-15T-MATA13 5 of 8 and 6 of 8) in **Appendix B** for reference) shows that there is an existing 200mm sanitary sewer is located along Ridge Road South. It is our understanding from the town as-built drawing that the site is currently being sanitary serviced from the existing 200mm sanitary sewer on Ridge Road South. The size of the existing sanitary service for the existing house is unknown.

The town staff has recommended to complete the third-party sanitary modeling analysis to confirm the available capacity of the existing 200mm sanitary sewer on Ridge Road South with respect to the proposed development. A 200mm PVC sanitary service has been proposed from the existing 200mm municipal sanitary sewer on Ridge Road South to service the subject development. **DWG 2** in **Appendix C** represents the proposed sanitary service connection for the proposed development. **Table C-2** represents the approximate sanitary flow generated from the subject development.

2.2. WATER SERVICES

An existing 150mm municipal watermain is available on Ridge Road South. A profile drawing (refer to drawing # ISE-15T-MATA13 5 of 8 and 6 of 8) in **Appendix B** for reference) shows that the site is currently water serviced which will need to be abandoned as part of the proposed development. A new 150mm PVC water service has been proposed from the existing 150mm municipal watermain on Ridge Road South to service the subject development. **DWG 2** in **Appendix C** represents the water service connection for the proposed development.

Hydrant flow test is recommended for the hydrants on Ridge Road South prior to approval to know the available domestic and fire flow in the vicinity of the development.

2.3. STORMWATER MANAGEMENT ANALYSIS AND DESIGN

As mentioned earlier, the existing municipal storm sewer on Ridge Road South will be able to provide storm servicing for the site. The stormwater management quantity control for the proposed development will be managed by providing underground storage chambers.

Stormwater quality will be managed by providing oil and grit separator (OGS) upstream of the storage chamber. **DWG 2** represents the storm servicing and location of the onsite storage system; **DWG 3** shows the grading plan, **DWG 5** represents storm drainage area plan and **Table C-1** depicts the storm sewer analysis and design for the subject site in **Appendix C**.

2.3.1. RAINFALL DATA & STORMWATER MODELING

The Chicago 3-hour storm has been used to determine the pre-development and post-development peak flows and onsite storage. Chicago storms are considered to a better estimate for the urban development peak flows. The stormwater management simulation was completed using SWMHYMO hydrologic model for 5 year and 100-year storm events in conformance with the Town of Fort Erie engineering standards. The model has been widely used in similar hydrologic analyses related to stormwater management across the province of Ontario and recognized as a reliable modelling tool available to simulate the hydrologic response to both rural and urban watershed under different storm events.

2.3.2. PRE-DEVELOPMENT CONDITIONS

Pre-development analysis was performed based on the existing topographic survey. The subject property generally drains from north to south towards the mid-south portion of the property. The allowable discharge rate for the site has been established based on pre-development conditions using CALIB NASHYD commend in SWMHYMO. **Figure D1** in **Appendix D** represents the pre-development drainage area boundary.

Table 1 represents a summary of hydrological parameters which has been utilized to develop the SWMHYMO model for the pre-development conditions.

Table 1: SWMHYMO MODEL INPUT PARAMETERS - PRE-DEVELOPMENT CONDITIONS				
AREA ID	AREA (HA)	CN	INITIAL ABSTRACTION (IA) mm	TIME OF PEAK (TP) HRS
101	0.54	80	0.80	0.22

Using the **Table 1** pre-development input parameters, the SWMHYMO model was simulated for 5 and 100-year design storm events. A summary of the pre-development peak flows is depicted in **Table 2**. Refer to **Appendix D** for SWMHYMO model pre-development conditions output files.

Table 2: PEAK FLOWS (cms) - PRE-DEVELOPMENT CONDITIONS 3HOUR CHICAGO STORM			
AREA ID	AREA (HA)	5 YEAR FLOW (cms)	100 YEAR FLOW (cms)
101	0.54	0.024	0.055

2.3.3. POST-DEVELOPMENT CONDITIONS

Overall proposed preliminary site grading has been established based on the proposed site plan layout and existing topography to minimize the cut and fill for the entire site. Based on the existing topography, the entire site currently drains from north to south towards the mid-south portion of the property. Under the post-development conditions, the site has been proposed to drain towards the existing storm sewer on Ridge Road South at the allowable pre-development discharge rate during post-development conditions under 5-year and 100-year storm events. **Figure D2** represents the post-development drainage area plan in **Appendix D**.

Table 3 represents a summary of the hydrological model parameters which has been used in the assessment of post development peak flows.

Table 3: SWMHYMO MODEL INPUT PARAMETERS - POST-DEVELOPMENT CONDITIONS									
AREA ID	AREA (HA)	CN	IMP (%)	LGI - Flow Length (m)	AVERAGE SLOPE (%)	IAPER (PERV.) (mm)	IAIMP (IMPERV.) (mm)	MNP (PERV.)	MNI (IMPERV.)
201	0.54	80	58	60	2.0	0.8	0.7	0.25	0.013

Using the **Table 3** post-development hydrological parameters, the SWMHYMO model was simulated for 5 and 100-year design storm events. A summary of the post-development peak flows is depicted in **Table 4**. Refer to **Appendix D** for SWMHYMO model post-development conditions output files.

Table 4: PEAK FLOWS (cms) - POST-DEVELOPMENT CONDITIONS 3HOUR CHICAGO STORM (UNCONTROLLED)

201	0.54	0.076	0.129
Total	0.54	0.076	0.129

2.3.4. STORMWATER QUANTITY CONTROL DESIGN

The proposed development will require onsite stormwater quantity control. The outflow rate of the site will be based on post-development outflow to match with pre-development conditions under 5-year and 100-year storm events. The onsite stormwater quantity control will be established by providing stormwater storage ADS underground chambers or equivalent which will detain storm runoff and control the post-development flows to pre-development conditions. The outlet of the proposed storage tank will be discharged to the existing 1200mm storm sewer on Ridge Road South.

Table 5 depicts the hydrologic simulation results of the proposed onsite stormwater storage system. **Appendix D** represents the SWMHYMO output files for the onsite stormwater quantity control.

Table 5: POST-DEVELOPMENT CONDITIONS 3HOUR CHICAGO STORM ONSITE STORMWATER MANAGEMENT QUANTITY CONTROL		
Description	5 YEAR STORM EVENT	100 YEAR STORM EVENT
PRE-DEVELOPMENT PEAK FLOWS - ALLOWABLE DISCHARGE RATE FOR THE SITE (cms) (Area 101)	0.024	0.055
UNCONTROLLED POST-DEVELOPMENT PEAK FLOWS (cms) (Area 201)	0.076	0.129
OUTFLOW RATE BASED ON REQUIRED STORAGE (cms)	0.023	0.035
REQUIRED ONSITE STORAGE (m3)	52.0	112.0

It has been noted in **Table 5** that the controlled post-development peak flows during post-development conditions are less than pre-development conditions under 5 year and 100-year storm events. **Appendix D** represents SWMHYMO model output files.

The post-development outflow rate will be discharged through the proposed 133mm orifice in the 300mm storm sewer which will be connected to the existing 1200mm storm sewer on Ridge Road South. The ADS chamber or equivalent stormwater storage system with inlets and outlet will be provided in the parking area as shown on the site servicing plan in **Appendix C**. Orifice size calculations, stage, storage and discharge curves are presented in **Appendix D**. Design for the storage chamber system was completed by ADS Inc. and included in **Appendix E**.

2.3.5. STORMWATER QUALITY CONTROL DESIGN

Enhanced Level 1 water quality treatment has been proposed. Stormwater quality will be controlled by providing oil and grit separator (OGS) upstream of the storage system which will control the water quality for the first flush. Ministry of Environment, Conservation and Parks (MECP) Level 1 (Enhanced) water quality criteria has been used to design the required OGS.

Design for the OGS was completed by ADS Inc. and included in **Appendix E**.

3.0 EROSION AND SEDIMENT CONTROL MEASURES

Erosion and sedimentation control measures must be implemented onsite during pre-grading activities, construction of primary and secondary services. All erosion and sediment control measures shall follow the manual “Erosion & Sediment Control Guideline for Urban Construction – December 2006”.

Design and implementation of an affective erosion control plan is very important for minimizing potential adverse environmental affects originating from onsite construction activities. Site specific erosion control measures can prevent erosion during construction to deal with sediments at the source and reduce the sediment transport from the construction site. Erosion control mitigation measures must be implemented through regular maintenance and monitoring specially after any storm event until the entire site has been constructed and all proposed/disturbed grass areas are stabilized.

Sediment transport during construction can be prevented by installation of sediment/silt control fence around the perimeter of the site. Sediment control fence consists of non-woven synthetic fabric material (geotextile) stretched across attached to the supporting post and wire fence. This measure significantly reduces the amount of sediment leaving the construction site and decrease the velocity of flow. Silt fence shall be installed as per OPSD – 219.130.

It is also required to provide storm drain inlet protection which consists of control the sediment entering into existing and proposed rear yard and street catch basins prior to the permanent stabilization of disturbed areas. Rear yard catch basins grate shall be covered by the filter cloth material with clear stone material whereas street catch basins will require to provide silt sack under the grate in the street catch basin.

It is recommended to lower the grade at the property approximately between 100mm and 150mm below the top of curb during pre-grading activity so that sediment leaving the site can be reduced. Vehicle tracking control/mud mats are also required to install at the entrance of construction site to prevent sediment transport from the construction site as per the erosion control guidelines.

DWG 4 in Appendix C represents erosion and sediment control plan.

4.0 CONCLUSION SUMMARY

Following are the conclusions for this functional servicing and stormwater management report:

1. There are adequate servicing infrastructures available to service the proposed development.
2. Proposed grading for the entire site has been designed with respect to existing grades all around the subject property and the proposed grades within the site have been set to minimize cut/fill in the proposed development.
3. Municipal sanitary sewers are available in the vicinity of the development and the proposed site will be serviced from the existing 200mm sanitary sewer available on Ridge Road South.
4. The existing 150mm municipal watermain is available on Ridge Road South which will be utilized for the domestic and fire flow requirements for the site. Hydrant flow test is recommended for the hydrants on Ridge Road South prior to approval to know the available domestic and fire flow in the vicinity of the development.
5. Onsite stormwater management quantity and quality controls are required for the subject development. Quantity control will require the post-development peak flows to match with pre-development peak flow conditions under 5-year and 100-year storm events. Onsite storage has been designed to maintained by providing underground storage system with an orifice control outlet discharge into the existing storm sewers on Ridge Road South. Stormwater quality will be maintained by providing OGS upstream of the storage system
6. Functional servicing and stormwater management design concepts presented in this report has been used as a basis for the detailed engineering design for the proposed development of the site.
7. Erosion and sedimentation control measures must be implemented onsite during pre-grading activities, construction of primary and secondary services to reduce the potential adverse environmental affects originating from onsite construction activities.

In conclusion, proposed sanitary, water and stormwater management servicing provided in this report are sufficient and in accordance with the Town of Fort Erie current development engineering design guidelines.

FORT ERIE, CANADA

SC-740 STORMTECH CHAMBER SPECIFICATIONS

- CHAMBERS SHALL BE STORMTECH SC-740.
- CHAMBERS SHALL BE ARCH-SHAPED AND SHALL BE MANUFACTURED FROM VIRGIN, IMPACT-MODIFIED POLYPROPYLENE COPOLYMERS.
- CHAMBERS SHALL BE CERTIFIED TO CSA B184, "POLYMERIC SUB-SURFACE STORMWATER MANAGEMENT STRUCTURES", AND MEET THE REQUIREMENTS OF ASTM F2418, "STANDARD SPECIFICATION FOR POLYPROPYLENE (PP) CORRUGATED WALL STORMWATER COLLECTION CHAMBERS".
- CHAMBER ROWS SHALL PROVIDE CONTINUOUS, UNOBSTRUCTED INTERNAL SPACE WITH NO INTERNAL SUPPORTS THAT WOULD IMPEDE FLOW OR LIMIT ACCESS FOR INSPECTION.
- THE STRUCTURAL DESIGN OF THE CHAMBERS, THE STRUCTURAL BACKFILL, AND THE INSTALLATION REQUIREMENTS SHALL ENSURE THAT THE LOAD FACTORS SPECIFIED IN THE AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS, SECTION 12.12, ARE MET FOR: 1) LONG-DURATION DEAD LOADS AND 2) SHORT-DURATION LIVE LOADS, BASED ON THE CSA S6 CL-625 TRUCK AND THE AASHTO DESIGN TRUCK WITH CONSIDERATION FOR IMPACT AND MULTIPLE VEHICLE PRESENCES.
- CHAMBERS SHALL BE DESIGNED, TESTED AND ALLOWABLE LOAD CONFIGURATIONS DETERMINED IN ACCORDANCE WITH ASTM F2787, "STANDARD PRACTICE FOR STRUCTURAL DESIGN OF THERMOPLASTIC CORRUGATED WALL STORMWATER COLLECTION CHAMBERS". LOAD CONFIGURATIONS SHALL INCLUDE: 1) INSTANTANEOUS (<1 MIN) AASHTO DESIGN TRUCK LIVE LOAD ON MINIMUM COVER 2) MAXIMUM PERMANENT (75-YR) COVER LOAD AND 3) ALLOWABLE COVER WITH PARKED (1-WEEK) AASHTO DESIGN TRUCK.
- REQUIREMENTS FOR HANDLING AND INSTALLATION:
 - TO MAINTAIN THE WIDTH OF CHAMBERS DURING SHIPPING AND HANDLING, CHAMBERS SHALL HAVE INTEGRAL, INTERLOCKING STACKING LUGS.
 - TO ENSURE A SECURE JOINT DURING INSTALLATION AND BACKFILL, THE HEIGHT OF THE CHAMBER JOINT SHALL NOT BE LESS THAN 50 mm (2").
 - TO ENSURE THE INTEGRITY OF THE ARCH SHAPE DURING INSTALLATION, a) THE ARCH STIFFNESS CONSTANT AS DEFINED IN SECTION 6.2.8 OF ASTM F2418 SHALL BE GREATER THAN OR EQUAL TO 550 LBS/FT/%. AND b) TO RESIST CHAMBER DEFORMATION DURING INSTALLATION AT ELEVATED TEMPERATURES (ABOVE 23° C / 73° F), CHAMBERS SHALL BE PRODUCED FROM REFLECTIVE GOLD OR YELLOW COLORS.
- ONLY CHAMBERS THAT ARE APPROVED BY THE SITE DESIGN ENGINEER WILL BE ALLOWED. UPON REQUEST BY THE SITE DESIGN ENGINEER OR OWNER, THE CHAMBER MANUFACTURER SHALL SUBMIT A STRUCTURAL EVALUATION FOR APPROVAL BEFORE DELIVERING CHAMBERS TO THE PROJECT SITE AS FOLLOWS:
 - THE STRUCTURAL EVALUATION SHALL BE SEALED BY A REGISTERED PROFESSIONAL ENGINEER.
 - THE STRUCTURAL EVALUATION SHALL DEMONSTRATE THAT THE SAFETY FACTORS ARE GREATER THAN OR EQUAL TO 1.95 FOR DEAD LOAD AND 1.75 FOR LIVE LOAD, THE MINIMUM REQUIRED BY ASTM F2787 AND BY SECTIONS 3 AND 12.12 OF THE AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS FOR THERMOPLASTIC PIPE.
 - THE TEST DERIVED CREEP MODULUS AS SPECIFIED IN ASTM F2418 SHALL BE USED FOR PERMANENT DEAD LOAD DESIGN EXCEPT THAT IT SHALL BE THE 75-YEAR MODULUS USED FOR DESIGN.
- CHAMBERS AND END CAPS SHALL BE PRODUCED AT AN ISO 9001 CERTIFIED MANUFACTURING FACILITY.

IMPORTANT - NOTES FOR THE BIDDING AND INSTALLATION OF THE SC-740 SYSTEM

- STORMTECH SC-740 CHAMBERS SHALL NOT BE INSTALLED UNTIL THE MANUFACTURER'S REPRESENTATIVE HAS COMPLETED A PRE-CONSTRUCTION MEETING WITH THE INSTALLERS.
- STORMTECH SC-740 CHAMBERS SHALL BE INSTALLED IN ACCORDANCE WITH THE "STORMTECH SC-310/SC-740/DC-780 CONSTRUCTION GUIDE".
- CHAMBERS ARE NOT TO BE BACKFILLED WITH A DOZER OR AN EXCAVATOR SITUATED OVER THE CHAMBERS. STORMTECH RECOMMENDS 3 BACKFILL METHODS:
 - STONESHOOTER LOCATED OFF THE CHAMBER BED.
 - BACKFILL AS ROWS ARE BUILT USING AN EXCAVATOR ON THE FOUNDATION STONE OR SUBGRADE.
 - BACKFILL FROM OUTSIDE THE EXCAVATION USING A LONG BOOM HOE OR EXCAVATOR.
- THE FOUNDATION STONE SHALL BE LEVELED AND COMPACTED PRIOR TO PLACING CHAMBERS.
- JOINTS BETWEEN CHAMBERS SHALL BE PROPERLY SEATED PRIOR TO PLACING STONE.
- MAINTAIN MINIMUM - 150 mm (6") SPACING BETWEEN THE CHAMBER ROWS.
- EMBEDMENT STONE SURROUNDING CHAMBERS MUST BE A CLEAN, CRUSHED, ANGULAR STONE 20-50 mm (3/4-2").
- THE CONTRACTOR MUST REPORT ANY DISCREPANCIES WITH CHAMBER FOUNDATION MATERIALS BEARING CAPACITIES TO THE SITE DESIGN ENGINEER.
- ADS RECOMMENDS THE USE OF "FLEXSTORM CATCH IT" INSERTS DURING CONSTRUCTION FOR ALL INLETS TO PROTECT THE SUBSURFACE STORMWATER MANAGEMENT SYSTEM FROM CONSTRUCTION SITE RUNOFF.

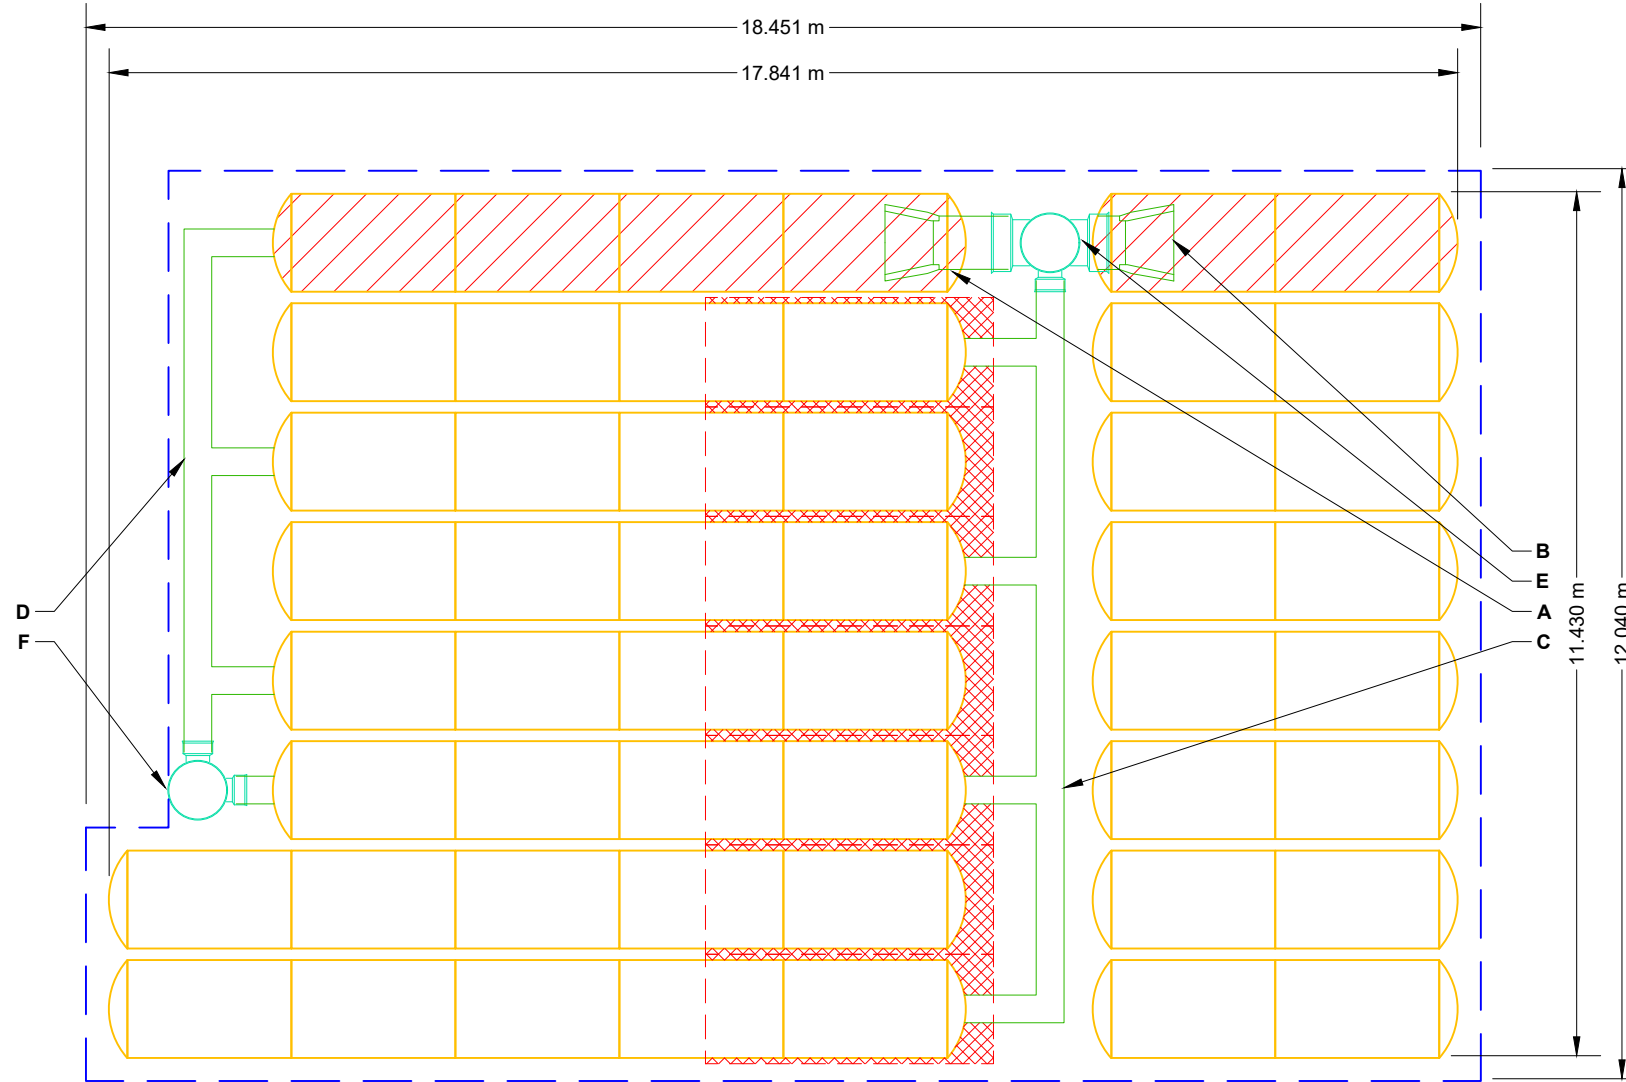

NOTES FOR CONSTRUCTION EQUIPMENT

- STORMTECH SC-740 CHAMBERS SHALL BE INSTALLED IN ACCORDANCE WITH THE "STORMTECH SC-310/SC-740/DC-780 CONSTRUCTION GUIDE".
- THE USE OF CONSTRUCTION EQUIPMENT OVER SC-740 CHAMBERS IS LIMITED:
 - NO EQUIPMENT IS ALLOWED ON BARE CHAMBERS.
 - NO RUBBER TIRED LOADERS, DUMP TRUCKS, OR EXCAVATORS ARE ALLOWED UNTIL PROPER FILL DEPTHS ARE REACHED IN ACCORDANCE WITH THE "STORMTECH SC-310/SC-740/DC-780 CONSTRUCTION GUIDE".
 - WEIGHT LIMITS FOR CONSTRUCTION EQUIPMENT CAN BE FOUND IN THE "STORMTECH SC-310/SC-740/DC-780 CONSTRUCTION GUIDE".
- FULL 900 mm (36") OF STABILIZED COVER MATERIALS OVER THE CHAMBERS IS REQUIRED FOR DUMP TRUCK TRAVEL OR DUMPING.

USE OF A DOZER TO PUSH EMBEDMENT STONE BETWEEN THE ROWS OF CHAMBERS MAY CAUSE DAMAGE TO THE CHAMBERS AND IS NOT AN ACCEPTABLE BACKFILL METHOD. ANY CHAMBERS DAMAGED BY THE "DUMP AND PUSH" METHOD ARE NOT COVERED UNDER THE STORMTECH STANDARD WARRANTY.

CONTACT STORMTECH AT 1-888-892-2694 WITH ANY QUESTIONS ON INSTALLATION REQUIREMENTS OR WEIGHT LIMITS FOR CONSTRUCTION EQUIPMENT.

NOTES

- MANIFOLD SIZE TO BE DETERMINED BY SITE DESIGN ENGINEER. SEE TECH NOTE #6.32 FOR MANIFOLD SIZING GUIDANCE.
- DUE TO THE ADAPTATION OF THIS CHAMBER SYSTEM TO SPECIFIC SITE AND DESIGN CONSTRAINTS, IT MAY BE NECESSARY TO CUT AND COUPLE ADDITIONAL PIPE TO STANDARD MANIFOLD COMPONENTS IN THE FIELD.
- THE SITE DESIGN ENGINEER MUST REVIEW ELEVATIONS AND IF NECESSARY ADJUST GRADING TO ENSURE THE CHAMBER COVER REQUIREMENTS ARE MET.
- THIS CHAMBER SYSTEM WAS DESIGNED WITHOUT SITE-SPECIFIC INFORMATION ON SOIL CONDITIONS OR BEARING CAPACITY. THE SITE DESIGN ENGINEER IS RESPONSIBLE FOR DETERMINING THE SUITABILITY OF THE SOIL AND PROVIDING THE BEARING CAPACITY OF THE INSITU SOILS. THE BASE STONE DEPTH MAY BE INCREASED OR DECREASED ONCE THIS INFORMATION IS PROVIDED.
- NOT FOR CONSTRUCTION:** THIS LAYOUT IS FOR DIMENSIONAL PURPOSES ONLY TO PROVE CONCEPT & THE REQUIRED STORAGE VOLUME CAN BE ACHIEVED ON SITE.
